Reconnaissance with Hacksearch Pro

Conducted passive reconnaissance using HackSearch Pro to identify publicly exposed assets and potential security risks associated with a target domain. This exercise demonstrates OSINT-based enumeration, analysis of indexed data, and evaluation of findings from a security perspective.

Cybersecurity-Portfolio: https://github.com/ingridsec/Projects

1 I initiated the reconnaissance phase by accessing HackSearch Pro, an OSINT-based tool used to automate the discovery of publicly exposed information. This approach focuses on passive intelligence gathering, avoiding direct interaction with the target system.

Personalize Your Firefox
Extensions and themes are like apps for your browser, and they let you protect passwords, download videos, find deals, block annoying ads, change how your browser looks, and much more. These small software programs are often developed by a third party. Here's a selection Firefox recommends for exceptional security, performance, and functionality.

13 The tool returned multiple results associated with the target domain. I reviewed these findings to identify subdomains, directories, and publicly accessible services contributing to the organization's attack surface.

I analyzed the results for potential security risks, including exposed endpoints, sensitive files, or misconfigured resources that could provide insight into the target's infrastructure.

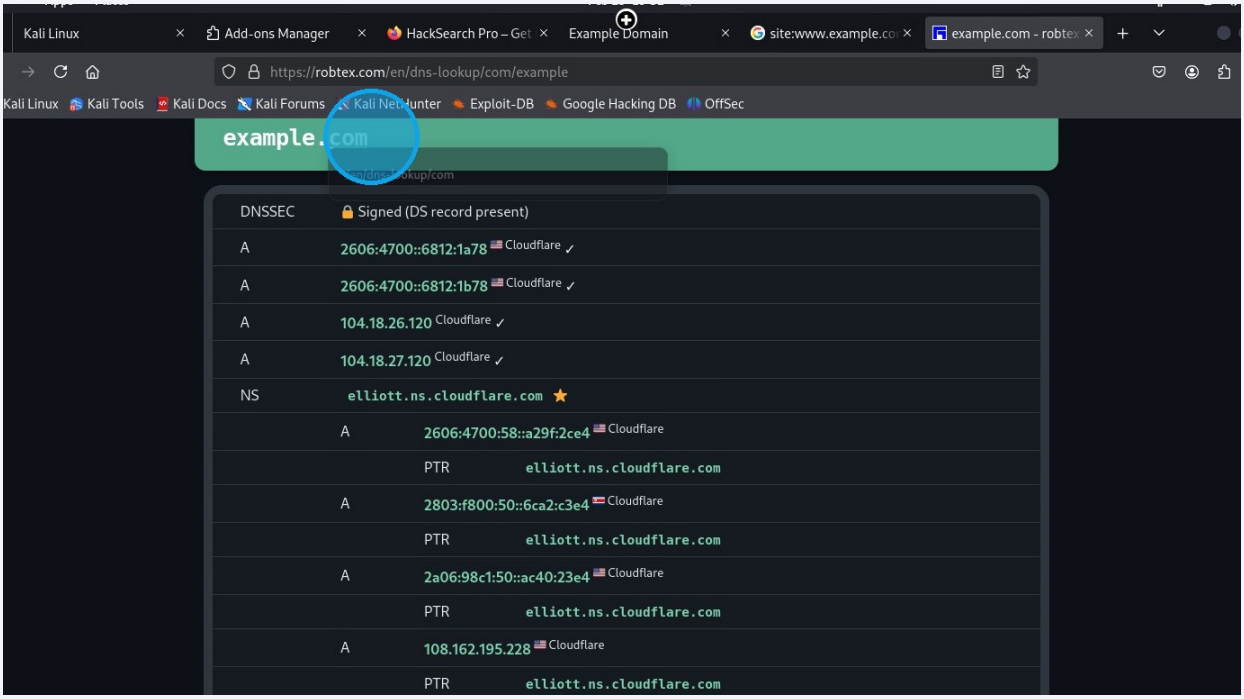
17 The tool returned multiple data points associated with the target domain. I reviewed these results to identify subdomains, directories, and exposed services that contribute to the organization's external attack surface.

I documented relevant findings, including URLs and resource types, to support further analysis and potential remediation efforts.



18 I documented relevant findings, including URLs and resource types, to support further analysis and potential remediation efforts.

This reconnaissance activity demonstrates how publicly available information can be leveraged to map an organization's attack surface without triggering detection mechanisms. Identifying exposed assets at this stage helps prevent exploitation by addressing misconfigurations early.
